2014 Regional Snapshot

Are the water levels and salinity of our prescribed groundwater resources improving?

The Eyre Peninsula NRM region relies on groundwater for its town water supplies and agriculture industry. Groundwater also sustains a range of ecosystems.

Groundwater is mostly recharged when rainfall percolates down through the soil to the water table. Groundwater levels naturally change in response to seasonal rainfall, droughts and climate change. Excessive use can cause levels to fall and salinity to increase, which can impact the communities, industries and ecosystems that are dependent on groundwater, particularly if climate change impacts rainfall patterns and reduces the rainfall needed to recharge groundwater.

This report summarises whether changes in groundwater levels and salinity of prescribed groundwater resources are within acceptable limits. This report should be read alongside reports on the <u>sustainable use of ground water</u> resources.

State target

Maintain the productive capacity of our natural resources

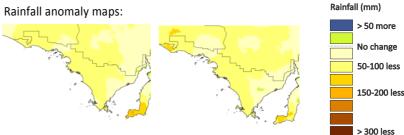

Trend (2010-13)

Stable

Salinity and groundwater levels are within acceptable limits in all 6 prescribed groundwater resources

Groundwater levels and salinity are largely driven by rainfall and are therefore naturally variable. Rainfall in 2013 was less than long term averages (maps on right). Water use in 2013 was therefore expected to be higher.

Since 2010, all of the prescribed groundwater resources have stable or improving water levels and salinity (map above), according to groundwater level and salinity reports.

compares to the last 113 years

How rainfall in the last 12 months How rainfall in the last 12 months compares to the last 10 years

Where we are at (2013)

Good

All 6 groundwater resources are within acceptable limits

In the Eyre Peninsula NRM region there are 6 groundwater resources (aquifers) within 2 prescribed areas. Based on changes in salinity and water levels between 2012 and 2013, the 2013 status of all 6 groundwater resources is good. There has been a gradual decline in water levels in the Polda aquifer, but values are still within acceptable limits. To ensure the long term sustainability of the resource, water use is being monitored closely and its use for public water supply has been restricted.

Managing our groundwater resources relies on consistent and timely measurements of groundwater levels, salinity and water use.

Reliability of information

Very Good
