

# 2014 Regional Snapshot

## How good is the scientific understanding of the causes and consequences of climate change?

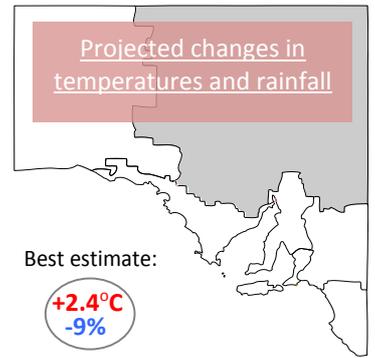

In 2012–13, Australia experienced its hottest summer, hottest month, hottest day and longest heatwave. In the same year, atmospheric carbon approached 400 parts per million – 40 per cent higher than 100 years ago and a level not seen for millions of years.

In the SA Arid Lands NRM region, average temperatures are projected to increase by 1.8–3.5 degrees Celsius by 2070 (map on right). We can also expect longer and hotter heatwaves, which will result in increased heat-related illness, hospital admittance and mortality rates.

Rainfall is projected to change in the region and could decrease by 30 per cent or increase by 15 per cent by 2070 (map on right). Changes in rainfall could reduce the frequency of groundwater recharge events, which may impact the level of localised aquifers. The Great Artesian Basin is unlikely to be impacted by changes to recharge frequency in South Australia because most of the water flows from across state borders.

Increasing temperatures and decreasing rainfall are likely to degrade the habitats of some native plants and animals and improve conditions for some pest animals and weeds.

This report summarises research by the Australian Bureau of Meteorology, the Government of South Australia, the Australian Government and the Intergovernmental Panel on Climate Change. The views of the South Australian public are addressed in a [separate report](#).

State target

Improve capacity of individuals and community to respond to climate change

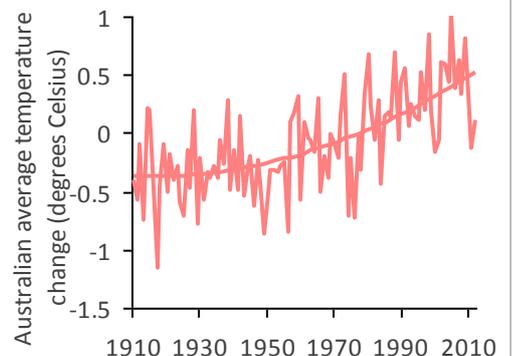

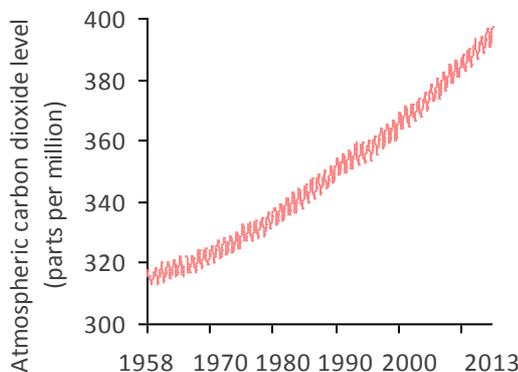

### Trend (1990–2013)

Getting better

Scientific understanding of the causes and the projected impacts of climate change is improving

Scientific understanding of climate change is improving, and increased data is resulting in increased certainty in projections of changes and impacts.

Observations of rising atmospheric carbon and temperatures contribute to improving the understanding climate change (graphs on right).

### Where we are at (2013)

Good

Research is focused on understanding the consequences of climate change to help us plan and adapt

The warming of the climate is unequivocal and human influence on the climate system is clear. Research is currently focused on improving our understanding of the consequences of climate change to help plan for potential impacts and help us adapt.

Policies, such as those under the [Climate Change Adaptation Framework](#), are being developed to help South Australians prepare for the projected changes to our climate.

### Reliability of information

Excellent
