## 2014 Regional Snapshot

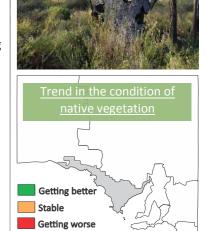

## Is the condition of our native vegetation improving?

South Australia's native vegetation - from small ground covers and native grasses to large trees and water plants - is fundamental to the health of our environment and the prosperity of our primary industries.

Native vegetation protects our land and water from erosion and dry-land salinity, while improving our agricultural productivity and storing <u>carbon</u>. It provides habitat for our native animals, places for recreation, gives our landscape its identity and is culturally important for Aboriginal people.

Human development has affected our native vegetation. It has reduced its <u>extent</u> (coverage), and decreased its <u>connectivity</u> (fragmentation). Our remaining native vegetation is under pressure from further fragmentation, inappropriate grazing and fire regimes, weeds, pests, plant diseases and firewood collection. Increasing water extraction, altered water flows, increasing soil salinity, rising groundwater, pollution and climate change are also threats. Several native vegetation communities in the state are now listed as <u>threatened</u>.

This report summarises the condition of our native vegetation, and should be read alongside reports on vegetation extent and connectivity, and protection.

Unknown

Not applicable

State target

Increase extent and improve condition of native vegetation

**Trend** 

Unknown

This is the first time this information has been collated. Trends will be available in the future.

We monitor the condition of native vegetation to ensure that our management activities are effective. Management includes controlling vegetation clearance, pests, weeds and grazing, and improving land-use practices.

Declines in the condition of our native vegetation since European settlement have largely been a result of agricultural and urban developments. Recent trends in the condition of our native vegetation are not known at regional or state scales (see map above), but its <u>protection</u> in 1991 and ongoing management aim to improve its condition and <u>extent</u>.

Where we are at (2014)

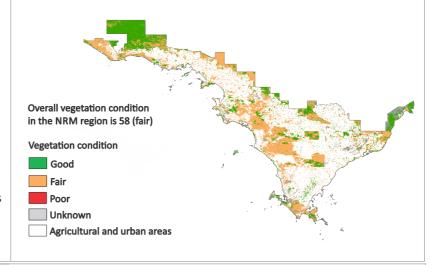

Fair

Our agricultural and urban developments have degraded much of our native vegetation.

Native vegetation <u>clearance</u> has been most intense around areas with extensive urban and agricultural development. Monitoring of the remaining vegetation patches in the Eyre Peninsula NRM region indicates that in general it is in fair condition (see map on right).

A <u>study</u> in 2011 by the Australian Government Department of Agriculture highlighted that 16 per cent of the region remains largely unchanged since European settlement.

The Department of Environment, Water and Natural Resources is assessing ways to standardise assessments of native vegetation condition for regional and statewide reporting.

**Reliability of information** 

Good
